

FP-5L Fuel Totalizer

Adding Fuel to the Fuel Totalizer

Toggle the switch so the green light is on REM then press both black buttons and ADD appears. Then press and hold left black button until fuel reads 000. Then press the left or right black button to move the cursor to the correct position and then using the toggle switch, select the fuel quantity (full will read 040) then press both black buttons to save. Or use the below QR code to see a video on how to add fuel.

Low Fuel Alarm

It has been pre-set to 10 gallons - a conservative fuel remaining level. When the fuel remaining reaches 10 gallons, a red low fuel light will begin to blink. If the red light blinks when the totalizer shows more than 10 gallons remaining, this means you should re-set the low fuel alarm by following the below instructions.

Set the green light to used with the toggle switch then press both black buttons and set digits to 000 which is the high fuel alarm (icon should appear on the top left) then press the right black button and the low fuel alarm icon should appear on the bottom left. Then set the next set of digits to appear to 010 which is 10 gallons (low fuel alarm) then press both black buttons to save. Now the only alarm that will come on is when 10 gallons or less are remaining.
